

Summary of CTEH's Air Monitoring Activities for the Community In Response to the MC 252 Oil Spill

Daily Summary for May 10, 2010

Air monitoring was conducted between Venice, LA and Panama City, FL to address public concern for crude oil vapors. The results of air monitoring for May 9, 2010 18:00 – May 10, 18:00 are shown in Table 1 and 2 below and the locations where monitoring was conducted are shown in the map below (Figure 1).

Table 1 Summary of Air Monitoring In Residential and Commercial Areas Along the Gulf Coast

Crude Oil Chemicals of Interest	Number of Measurements	Average Concentration (ppm)	Maximum Concentration (ppm)
Volatile Organic Chemicals including benzene (VOCs)	340	0	0
Hydrogen sulfide	322	0	0
Sulfur dioxide*	204	0	0
Benzene*	20	0	0
Total	886		

*Benzene and sulfur dioxide measured with detector tubes

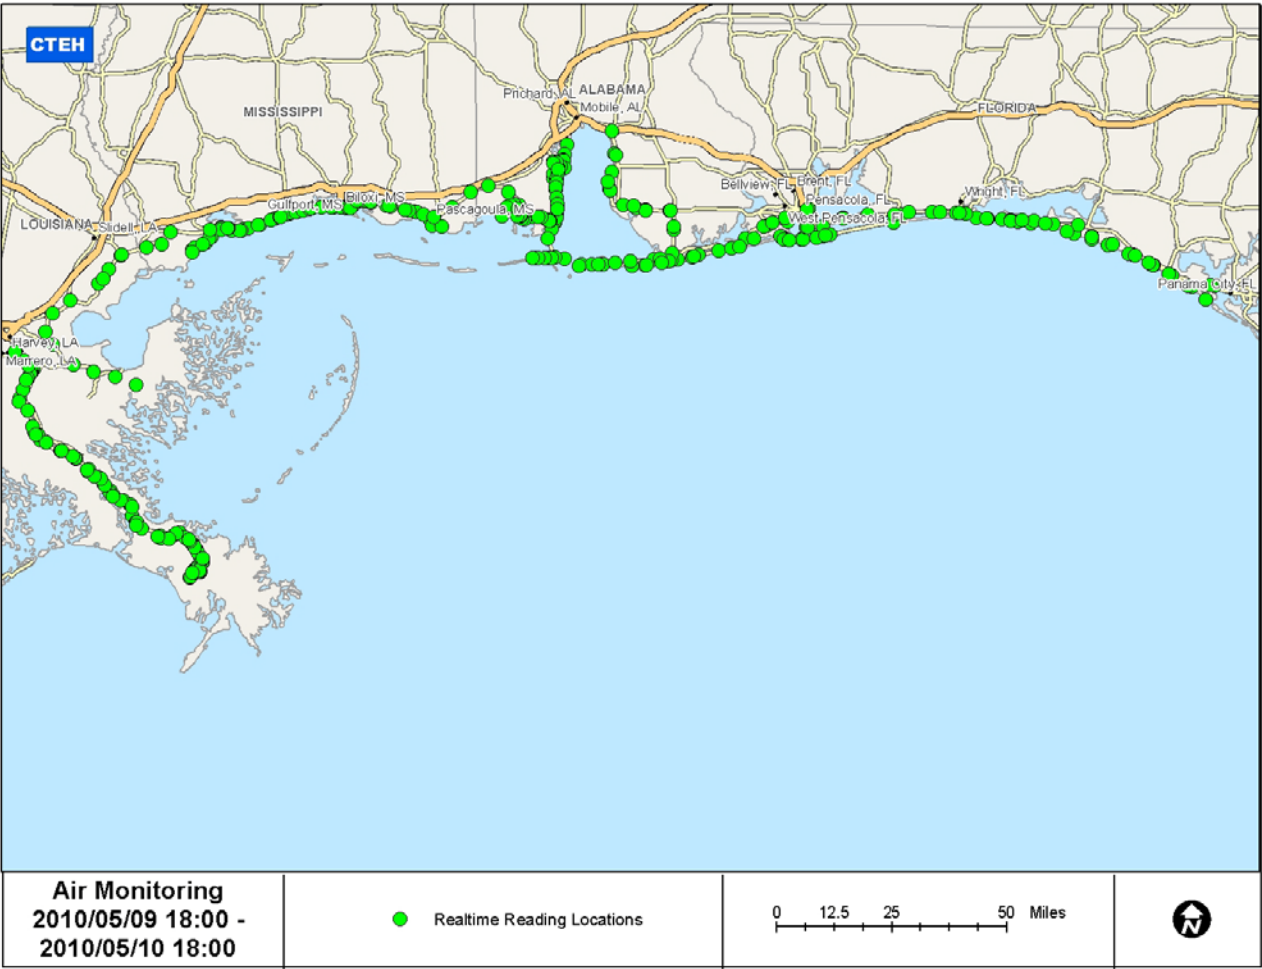

Table 2

Particulates	Number of Measurements	Average Concentration (mg/m ³)	Maximum Concentration (mg/m ³)
Particulate Matter (PM10)*	237	0.010	0.087
Total	237		

*PM10 – is particulate matter less than 10 microns

Air monitoring results show that crude oil vapors were not detected throughout residential and commercial areas between Venice, LA and Panama City, FL. Particulate levels show that concentrations were in range with baseline readings and were below levels of concern. Testing teams trained in odors also noted the presence or absence of crude oil vapors (Figure 2). No crude oil odors were detected between Venice, LA and Panama City, FL.

Figure 1 Map Showing Where Air Monitoring is Being Conducted Throughout the Gulf Coast States

Note – green dot shows the locations of air monitoring
